                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The polypeptides and polynucleotides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration, psoriasis, Cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the PCR primer of the invention which was used to analyse the human PRO DNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a primer which was used in the isolation of one of sixty one nucleic acids encoding novel secreted and transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatoid arthritis, multiple sclerosis), infertility, AIDS and disabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and

These CmYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a PCR primer which is used for amplifying beta-glucuronidase (GUS) reporter gene. GUS reporter gene is used for the construction of plasmids for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ATM; ataxia telangiectasia; mutation detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is one of a number of primers used in a method for contecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectasia, or a polyexonic cultaryotic gene of at least 4 kb. The method uses an improved version of allows electrophoresis of two or three amplified segments in a single cultaryotic genes such as the ATM gene amplified segments in a single cultaryotic genes such as the ATM gene for mutations and polymorphisms. The new mutations and polymorphisms in the ATM gene are useful for performing more accurate screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening methods. The mega-SSCP method provides a screening method of genes for multiple polymorphisms and mutations at once. The method is particularly suitable for large, polyexonic, eukaryotic genes, having mutations and polymorphisms at many points and not merely at one or a few hot spots. Note: the SEQ ID assigned to this sequence in the disclosure and claims of the the specification is one number lower than the number given in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                kidney
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
```

The present invention which encode proteins

describes polynucleotide sequences of having increased expression in kidney

rat origin

analyzing or angiog

angiogenic

Example

4; Page 296; 314pp; Japanese.

The polynucleotides can be used in the diagnosis, treatment and prevention of kidney disease, especially of proliferative glomerular nephritis, and in the repair of tissues damaged by kidney disease. ABA77002 to ABA77154 and AAG68138 to AAG68147 represent sequences given in the exemplification of the present invention
  New isolated nucleic acid for producing a PRO polypeptide, genetic disorders and treating cardiovascular, endothelial disorders, such as atherosclerosis, wounds or cancer.

comprising a PRO protein, agonists or antagonists of a PRO protein, and compounds which inhibit the expression of a PRO gene. The invention CC additionally encompasses methods of identifying modulators of PRO CC angiogenic disorder, or a susceptibility to such a disorder by detecting CC mutations in a PRO gene, or the expression level of a PRO gene within a CC particular tissue; treating a cardiovascular, endothelial or aparticular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO agonist or antagonist; a retroviral gene therapy vector comprising a CC PRO mucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the cardiovascular, endothelial, or angiogenist or antagonist of a PRO proteins, antibodies against PRO proteins, PRO concleic acid, PRO proteins, antibodies against PRO proteins, PRO cardiovascular, endothelial or angiogenic disorders, such as a cardiovascular, endothelial or angiogenic disorders, such as treation, endothelial or angiogenic disorders, and in the cardiovascular production, proteins, to map gene endothelial or stroke, pro nucleic acids are additionally useful in the crangenic animals useful for the development and screening of potential therapeutic agents. The protein of t

                                                                                           The invention relates to synthetic oligonucleotides which are capable of inducing exythroid differentiation for the manufacture of a medicament for the therapeutic treatment of beta-thalassaemia and neoplastic diseases. The invention also relates to a pharmaceutical composition comprising at least a synthetic oligonucleotide and a pharmaceutical acceptable carrier. Synthetic oligonucleotides comprises nucleic acid sequences selected from the group consisting of human gamma-globulin gene promoter or gamma-globulin/delta-beta cluster coding nucleic acid sequence. The present DNA sequence is human gamma-delta-beta globin gene synthetic oligonucleotide. This oligonucleotide is used for inducing erythroid differentiation
                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotides useful for inducing erythroid differentiation comprises human gamma-globulin or gamma-globulin/delta-beta cluster coding nucleic acid sequence.

(GENO-) GENOME THERAPEUTICS CORP.

WPI; 2001-639428/73

Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.

Example 10; Page 149; 520pp; English.

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases

Additionally, the nucleic acids may be used to produce the CC secreted Gene 216 protein, by inserting the nucleic acids into a host CC complementary sequences may also be used as DNA probes in diagnostic CC assays to detect and quantitate the presence of similar nucleic acids sequences in samples and therefore which patients may be in need of CC the production of antibodies against Gene 216 septements and activity. The anti-Gene 216 protein may also be used as antigens in CC the production of antibodies against Gene 216 and in assays to identify CC antibodies and antagonists may also be used as antigens in CC the production of antibodies against Gene 216 and in assays to identify CC antibodies and antagonists may also be used as diagnostic CC agants for detecting the presence of Gene 216 proteins in samples (e.g. CC by enzyme linked immunosorbant assay or ELISA). Disorders that may be prevented, diagnosed and/or treated by the above methods include, for CC cample asthma, obesity and inflammatory bowel disease. The present CC (ABZ72067-ABZ72088), polymorphism identifiction using single strand CC conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184), CC sequencing (ABZ72185-ABZ72186) and genotyping (ABZ7217-ABZ72362)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 1439
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

                                                    This invention describes a novel epididymis-specific human protein HE12 which has antiinfertility and contraceptive activity. The products of the invention modulate heparin and apolipoprotein A-I binding in the epididymis and thus capacitance of sperm. The protein of the invention, also similar sequences from other animals, their derivatives and fragments, are useful for diagnosis of male infertility. Antibodies (Ab) directed against the protein and nucleic acid that encodes it, are useful for treatment of male infertility and as reversible contraceptives since they have a post-testicular site of action and do not interfere with hormone metabolism. This sequence represents a PCR primer used in the amplification of the canine epididymis-specific polynucleotide described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes human GASC1 (gene amplified in squa cell carcinoma 1). GASC1 has been located to the p23-24 region of h chromosome 9. GASC1 can be used in the diagnosis and investigation diseases with which cell differentiation and proliferation are associated, such as cancer. It can also be used in gene therapy of diseases, and screening substances for their ability to modify the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Canine; epididymis-specific protein; CE12; anticontraceptive; heparin binding; apolipoprotein sperm capacitance; male infertility; post-testi
                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New epididymis-specific protein, also related nucleic acid and antibodies, useful for diagnosis and treatment of male infertility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2002-179467/23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-JUN-2000; 2000DE-01028376
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-JUN-2001; 2001WO-EP006554.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; mouse; Fas/Fas ligand system; Fas; antibody; light chain; heavy chain; apoptosis; antiallergic; immunosuppressive; apoptotic; sutoimmune disease; allergy; atopy; PCR primer; ss.

The agent has antiallargic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, attopy and others. The present sequence is that of a PCR primer useful in the construction of anti-Fas antibodies of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to compositions and methods useful for the cidentification and detection of polycystic kidney disease (PKD1) gene cumulations. The invention also relates to primers comprising a 5' region having a sequence that selectively hybridises to a PKD1 gene sequence and cc optionally, to a PKD1 homologue sequence and madjacent 3' region having a sequence that selectively hybridises to a PKD1 gene sequence and not to a PKD1 homologue sequence. Primer pairs of the invention are useful for cc a PKD1 homologue sequence of a mutation in a PKD1 polynucleotide cc in a sample, for identifying a subject at risk for a PKD1 associated cc disorder such as autosomal dominant polycystic kidney disease (ADPKD) or acquired cystic disease and for diagnosing a PKD1 associated disorder in cashject. They are useful for selectively amplifying a region of a PKD1 gene. PKD1 DNA fragments are useful detecting the presence of a mutant CC pene. PKD1 DNA fragments are useful detecting the presence of a mutant CC reaction, in hybridisation or amplification assays of biological samples to detect abnormalities of PKD1 expression and for engineering transgenic capitals The presence of a mount of a proper section assays of biological samples to detect abnormalities of PKD1 expression and for engineering transgenic and the property mutants of the presence of a mutant of a property mutants of the presence of pKD1 expression and for engineering transgenic and the property mutants of the presence of the property mutants of the presence of the property mutants of the presence of the property mutants of the property mutants of the presence of the property mutants of the property mutants of the presence of the property mutants of the property mut
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

cancer, hypertension, NOVX polypeptides and a disorder associated polynucleotides, useful for preventing or treating with aberrant NOVX expression or activity e.g., atherosclerosis, cardiomyopathy or bronchial

ü Page 728; 1103pp; English

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity cardiomyopathy or ç hypotensive

                                                                                                                                                                                                                                                                       The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; mouse; humanised anti-Fas antibody; Fas/Fas ligand; light chain subunit; apoptosis; immunosuppressive; antiallergic; autoimmune disease; allergy; atopic; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polymucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABX97008-ABX97185 which encode the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a preventive or treating agent for diseases caused by abnormality in Pass/Pass ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in ABQ80141-52 represent primers which were used to identify wild type and variant loci in the human interleukin 4 receptor (II4R). These primer sequences were used in the method of the invention for determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic acid sample of the individual, where the presence of the allele indicates the individual's risk for type 1 diabetes. The method identifies one or more single nucleotide polymorphism (SMP) within the II4R gene listed in the specification. The method and the SNP's are useful for determining an individual's risk for any autoimmune disease or condition or any Thelper type 1 mediated disease, e.g. rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, systemic lupus crybrenditis, myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

```

```
The invention describes a new isolator control of the pNA deposited with the American CC Type Culture Collection (e.g. ATCC Deposit No. 209258), or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide comprising CC any of 61 sequences having 164-1119 amino acids fully defined in the specification. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are cC particularly useful for detecting or treating e.g. Parkinson's disease, and independent on the colorestal concer), haemorrhage (or reduce risk for haemorrhage), returnsis of the liver, fibrosis of the lungs, cratering e.g. dermal fibrotic conditions (e.g. keloids or scarring), cC restenosis, dermal fibrotic conditions (e.g. keloids or scarring), cc ischaemia, strokes, hypertension, heart attacks, atherosclerosis, or infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep, cpigs, goats, or rabbits) The PRO polypeptides are useful as targets for the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of thuman cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of novel human CC polypeptides referred to as NOVX (NOVI-NOV37), variants of these CC proteins, and the polynucleotide sequences encoding them. The NOVX proteins of the invention share homology to varies types of protein CC lipoproteins. The sequences of the invention may be useful in the CC manufacture of a medicament for treating a syndrome associated with a CC human disease. For example they can be used to treat inflammatory CC disorders, demyelination disease, renal disorders, infections, CC cardiomyopathy, atherosclerosis, hypertension, stroke, pancreatitis, Von CC hippel-Lindau, endometriosis, fertility, scleroderma, cirrhosis, CC diseases, allegies, graft versus host disease, haemophila, autoimmune CC diseases, allegies, graft versus host disease, haemophila, autoimmune CC arthritis, parkinson's disease, Huntington's disease, obesity, diabetes, acne, hair growth/loss, asthma, schizophrenia, AIDS, pain, CC acne, hair growth/loss, asthma, schizophrenia, AIDS, pain, CC acne, control of the present a PCR primer used in the examples of the present convention. Note: SEQ ID Nos 113-460 are known sequences used for homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated PRO polypeptide having at least 80% cc amino acid sequence identity to: (a) any one of 61 fully defined amino cc acid sequences given in the specification (appearing as ABUS4347—cc ABUS4407); (b) an amino acid sequence encoded by the nucleotide sequence cdeposited under American Type Culture Collection (accession numbers collection the specification); (c) any one of the PRO sequences which clacks its associated signal peptide; (d) an extracellular domain of the PRO polypeptide which lacks its associated complypeptides, vectors, host cells and auti-pro antibodies. The PRO copypeptides, vectors, host cells and auti-pro antibodies. The PRO copypeptides and nucleic acids are useful in diseases associated with cancer such as squamous cell carations, skin diseases, e.g. character such as squamous cell carations, skin diseases, e.g. character such as squamous cell carations, brintlementry diseases, e.g. character such as squamous cell carations, or multiple sclerosis or span failure, catherosclerosis, cardiac injury, infertility, birth defects, premature caping, AIDS, cancer, diabetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapites concerned with re-growth of tissue. The nucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating caping, AIDS, cancer, diabetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapites concerned with re-growth of tissue. The nucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating of concerned with research to dentify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and sercening of the respective and the protein and sercening of protein and certain pr

The invention relates to an isolated PRO polypeptide. PRO317 is useful in CC diagnosing or treating abnormal bleeding involved in gynecological CC diseases e.g. to avoid or lessen the need for hysterectomy. PRO317 may CC also be useful as an agent that affects angiogenesis and PRO317 is useful CC in anti-tumour indications or in treating coronary ischaemic conditions. CC PRO211 and PRO217 polypeptides are useful for treating disorders CC associated with the preservation and maintenance of gastrointestinal CC mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis). CC PRO187 polypeptide is useful for treating Parkinson's disease, anyotrophic lateral sclerosis (ALS), neuropathies CC and disease related to uncontrolled cell growth, e.g. cancer. PRO219 colypeptide plays a regulatory role in the blood coagulation cascade. CC PRO246 polypeptides which serves as tumour specific antigens may be colypeptide is useful as an antithrombotic agent with reduced risk for CC haemorrhage as compared with heparin. PRO317 polypeptides useful in treating endometrial bleeding angiogenesis. PRO287 polypeptides and creating endometrial bleeding angiogenesis. PRO287 polypeptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pilvaroff E, Pong S, Gao W, Godowski PJ, Grimaldi JC, Gur Mather JP, Pan J, Paoni NF, Williams PM, Wood WI:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14-SEP-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          psoriasis and multiple sclerosis. The polypeptide and its nucleic acid are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human gene 216 polymorphism detection PCR primer #86.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present sequence represents a human secreted/transmembrane PRO polypeptide PCR primer

New isolated gene 216 nucleic acids, useful for diagnosing, preventing treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel ö

Example 10; Page 155; 650pp; English.

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nuclectide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obesity, or inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19

New secreted and transmembrane PRO polypeptides (e.g. PRO533 or PRO245) and genes encoding them, useful for detecting or treating e.g. hyperplasia, endometriosis, cancers, ischemia, coronary arterial diseas or inflammations. disease

Example 42; Page 112; 477pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating raise

The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. hyperplasia, endometriosis, cancers (e.g. those involving solid tumours), ischaemia, coronary arterial disease, polycystic kidney disease, chronic or acute renal failure, or inflammatory responses (e.g. asthma, rheumatoid arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX96017-ABX96378 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene therapy; mucosal lesion; ulcer; enterocolitis, skin disease; psoriasis; cancer; lung cancer; colon cancer; nerve cell disease; psoriasis; cancer; lung cancer; colon cancer; providence; anglogenesis; Alzheimer's disease; Parkinson's disease; Usher syndrome; anglogenesis; atrophia areata; inflammatory disease; asthma; rheumatoid arthritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to sixty one nucleic acids encoding PRO college (secreted and transmembrane). The polypucheotide is useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polypucleotide may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptide or the antibody is used in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as mucosal lesions e.g. ulcers and enterocolitis, skin disease e.g. psoriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease e.g. altheimer's disease and Parkinson's disease e.g asthma and crophia areata, angiogenesis, inflammatory disease e.g asthma and crophia areata, angiogenesis, inflammatory disease e.g asthma and color cancer in the present sequence represents an PCR primer used in isolating a PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

treating PRO polypeptides and nucleic acid molecules, useful in diagnosing or ating inflammatory diseases, organ failure, atherosclerosis, cardiac ury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's

Example 42; Page 106; 473pp; English.

(secreted and transmembrane). The PRO polypeptides and nucleic acids are cuseful in diagnosing or treating entercoclitis, gastrointestinal culceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic clateral sclerosis, inflammatory disease, Parkinson's disease, amyotrophic clateral sclerosis, inflammatory diseases, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, clabour, infertility, birth defects, premature aging, AIDS, cancer, clabour, infertility, birth defects, premature aging, AIDS, cancer, class complications, or mutations in general. The polypeptides are class useful for wound repair and associated therapies concerned with recombination gene therapy, and as molecular weight markers for protein clectrophoresis purposes. The anti-pRO antibodies may be used in recombinant cell culture or natural sources. This sequence represents a recombinant cell culture or natural sources. This sequence represents a describes sixty one nucleic acids encoding PRO polypeptides des and nucleic acids are

                                                                                                                                                                                                                                                  The present invention relates to an immortalized cell line of epididymal origin produced by immortalizing primary cultures of mammalian epididymal cells. The cells are useful for identifying agents that increase or reduce male fertility (potentially useful for treating infertility or as a contraceptives) and to assess their cytotoxicity, analysing the function of the epididymis and assessing activity of a promoter (by expressing a gene controlled by it in the cells. They can also be used in co-cultures with sperm, in serum-free medium, for macuration of the sperm. The present sequence is a PCR primer used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.

Example 42; Page 106; 467pp; English.

The invention relates to an isolated secreted and transmembrane PRO colypeptide. The PRO polypeptides are useful for modulating biological cativity of a cell, in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for condition, disorders associated with the preservation and maintenance of condition, disorders associated with the preservation and maintenance of condition, skin diseases associated with abnormal keratinocyte disferentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's codisease, amyotrophic lateral sclerosis (ALS), neuropathies, disease codisease, amyotrophic lateral sclerosis (ALS), neuropathies, disease codisease, amyotrophic lateral sclerosis (ALS), neuropathies, disease codisease, amyotrophic lateral sclerosis (ALS), neuropathies, disease, calated to uncontrolled cell growth (e.g. cancer), blood coagulation cascade disorders, neurodegenerative disease, thrombosis, haemorrhage, condentries, multiple sclerosis. Nucleic acid encoding PRO polypeptides are useful in molecular biology including uses as hybridisation probes and in the generation of antisense RNA and DNA, for preparing PRO polypeptides, des are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for generating transgenic animals or knockout animals. The PRO polypeptides and their nucleic acids are useful for tissue typing. PRO antibodies are useful for munchistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum for affinity purification of PRO from recombinant cell culture or natu sources. The present sequence represents a human secreted and transmembrane PRO polypeptide PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADB29491 standard; DNA; 19

The invention discloses isolated PRO secreted/transmembrane polypeptides can the nucleic acid encoding them. The polypeptide can be used to raise anthodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protectian and for modulating at least one biological activity of a cell. PRO polypeptide are useful for metal representation of the PRO polypeptides are useful for metal representation and for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful for treating disorders associated with the preservation and maintenance of search, skin diseases are useful for modulating the biological activity of a cell. PRO polypeptides are also useful controlled the polypeptides are also useful controlled cell expressing a PRO polypeptides are also useful of the properties and maintenance of search, skin diseases are call expressing a PRO polypeptides are also useful controlled cell systems. Alzheimen's disease, amyotrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled cell growth, e.g. cancer of controlled the properties also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also capholic terms and the properties can be also used in assays to determine the fitted of the properties and their portions affect on their reversal, as an antithromboric agent with reduced risk for hemorrhage as compared with controlled therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine the properties and their portions affect the expression of compared with reduced risk for hemorrhage as compared with the properties and their portions affect the expression of modulating uses as hybridisation probes for chan, in controlled and their portions affect the expression of antisense RNA and DNA. Controlled and their portions affect the expression of the RNA and DNA. Controlled and their portions

sclerosis.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptides are useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin disease associated with abnormal keratinocyte diseases, anyotrophic lateral sclerosis (ALS), neuropathies and diseases, anyotrophic lateral sclerosis (ALS), neuropathies and ç e.g. cancer

> cc infection. The PRO polypeptides can be also used in assays to determine cc if it has a role in neurodegenerative diseases or their reversal, as an cantithrombotic agent with reduced risk for haemorrhage as compared with eparin, in treating other PRO-associated disorders, in modulating cc endometrial bleeding angiogenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of cc genes which have a role in apoptosis. The polynucleotides are useful in cc chromosome and gene mapping, in the generation of artisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or chromosome and gene mapping, in the generation of artisense RNA and DNA, cf preparing PRO polypeptides, for generating transgenic animals or cc knockout animals which are useful in the development and screening of therapeutically useful respents, as probes and for the genetic analysis or findividuals with genetic disorders as well as for recombinantly cc expressing the protein and for chromosome identification. The proteins cc are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO coppeptide (alta-gonists) or prevent the effect of the PRO polypeptide (alta-gonists) or prevent the effect of the PRO polypeptide (are useful for rissues are useful in cc diagnostic assays for PRO e.g. detecting its expression in specific cc ells, tissues or scrum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be sequence presented is a PCR primer which was used to amplify a PRO colymucleotide of the invention. PRO polypeptides also serves as tumour specific antigens exploited as therapeutic targets for anti-tumour drugs, a employed therapeutically in vivo for lessening the effect the effects of are viral also

```
The invention relates to an isolated nucleic acid molecule comprising a ceremone with at least 80% identity to: (a) a nucleotide encoding any of cell PRO (secreted and transmembrane protein) polypeptides appearing as CC AB032756-AB032816; or (b) any of 61 nucleotide sequences having 50-4053bp CC fully defined in the specification; or the full length coding sequence of any these 61 nucleotide sequences. Also included are the isolated PRO CC polypeptide (lacking its associated signal peptide or an extracellular CC comprising the propertide, with or lacking its associated signal peptide), a vector comprising the nucleic acid molecule, a host cell comprising the vector (used to produce the PRO polypeptide), a chimaeric considerable, a host cell comprising the PRO polypeptide fissed to a heterologous amino card sequence, an anti-PRO anti-PRO anti-PRO anti-PRO anti-PRO anti-PRO anti-PRO anti-PRO polypeptide for a cell expressing a PRO245 cor PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptides are useful as pharmaceuticals, diagnostics, biosensors cor bioreactors. These are particularly useful for diagnostics, biosensors cor bioreactors. These are particularly useful for diagnostics, biosensors (e.g. cancers), strokes, heart attacks, hypertension, gastrointestinal constitutions, parkinson's disease, Alzehmer's disease, or AIDS in C mammals. These are also useful for modulating cholesterol uptake in the body, and in wound healing or tissue repair. The PRO polypeptides are useful as hybridisation probes, or for screening libraries of human connect is an oligonucleotide (PCR primer or probe) used in the sequence is an oligonucleotide (PCR primer or probe) used in the constant of a PRO CDNA

Novel encoding them, useful for treating abnormating gynecological diseases, skin diseases and secreted and transmembrane PRO polypeptides and polynucleotides ing them, useful for treating abnormal bleeding involved in ological diseases, skin diseases and neurodegenerative diseases.

Example 42; Page 108; 475pp; English.

The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polypucleotides encoding them. The PRO polypeptides and polypucleotides can be used in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy. They can also be used in treating coronary ischaemic conditions, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair acute and chronic mucosal lesions, skin diseases associated with abnorm keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, asthma, rheumatoid arthritis, multiple sclerosis, amyotrophic lateral sclerosis (ALS), neuropathies and diseases related uncontrolled cell growth, such as cancer. This sequence represents a PC professional related to the professional related and related the scale of the second related and related to the second related to the second related to the second related related to the second related to the second related related to the second related rela growth, bu PRO cancer. This sequence a polynucleotide of the represents invention abnormal of f ç

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC cells, modulating glucose or FFA uptake, inducing proliferation and/or redetecting or treating cardiac insufficiency disorders, wounds, cancerous continuous, retinal disorders or injuries (e.g. loss of sight due to cretinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or carthritis) in mammals. PRO polypeptides and their portions affect the cart useful in molecular biology including uses as hybridisation probes concerved for cDNA, library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antisense RNA cand DNA, for preparing PRO polypeptides, for generating transgenic canimals or knockout animals which are useful in the development and concerning of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for component and the proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents, for generating compounds to identify the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antipodies are useful for tissue typing. PRO antibodies are useful for cuseful for tissue typing. PRO antibodies are useful for continuous to identify and/or assay of sample fluids. Anti-PRO continuous to the protein and for affinity continuous to the protein and for affinity continuous to the protein and for affinity and/or assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity and defective gene. The sequence presented is a PCR primer which was used to camplify a PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise cantibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating cc bloactive molecule to a cell expressing a PRO polypeptides are useful cfor detecting other PRO polypeptides in a sample and for linking a cc bloactive molecule to a cell expressing a PRO polypeptide are useful completed to a cell expressing a PRO polypeptide or The PRO cc polypeptide antibodies are useful for modulating the biological activity collection and the properties or collections. The properties or collections are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. These are useful for stimulating hypertrophy of meonatal cheart, inhibiting vascular endothelial growth factor (VEGP) stimulated proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation and/or receptor cells, inducing c-fos in endothelial creation of useful collection proliferation and/or receptor cells, inducing c-fos in endothelial creation of the proliferation and/or receptor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

Example 42; SEQ ID NO 286; 479pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides CC and the nucleic acid encoding them. The polypeptides can be used to raise CC antibodies that specifically bind to the PRO polypeptide, for linking a CC bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for linking a CC bloactive molecule to a cell expressing a PRO polypeptide. The PRO CC polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptide are also useful CC for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal clesions, skin disease associated with abnormal keratinocyte differentiation (e.g. psoriasis), parkinson's disease, Alzheimer's CC diseases, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. CR PRO polypeptides also serves as tumour specific antigens which may be captived therapeutically in vivo for lessening the effects of viral captive disease, and neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with heparin, in treating other PRO-associated disorders, in modulating endometrial bleeding angiogenesis, and may also have an effect on kidney

CC tissue. PRO polypeptides and their portions affect the expression of CC genes which have a role in apoptosis. The polynucleotides are useful in CC chomosome and gene mapping uses as hybridisation probes for cDNA library CC to isolate the full-length PRO cDNA or to isolate other cDNAs, in CC chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or CC knockout animals which are useful in the development and socreening of therapeutically useful reagents, as probes and for the genetic analysis CC expressing the protein and for chromosome identification. The proteins CC expressing the protein and for chromosome identification. The proteins CC the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunchistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in cells, tissues or serum and for affinity purification of PRO from compinant cell culture or natural sources. The PRO genes may also be sequence presented is a PCR primer which was used to amplify a PRO colymucleotide of the invention.

The polypeptides and polynucleotides are used for treating CC diseases related to growth or survival of nerve cells such as Parkinson's CC disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS) and CC cancer, viral infections, Usher's syndrome, haemorrhage, enterocolitis, CC zollinger-Ellison syndrome, gastrointestinal ulceration, congenital CC microvillus atrophy, skin diseases such as soriasis and epithelial CC cancers, endometrial bleeding, angiogenesis, ischaemic conditions, CC asthma, rheumatoid arthritis, multiple sclerosis, inflammatory diseases, CC asthma, respective and diabetic complications. The polynucleotides are CC aging, AIDS, stroke and diabetic complications. The polynucleotides are CC also useful in chromosome and gene mapping. This sequence represents a CC PCR primer used in isolation of a human PRO polynucleotide of the CC invention
                                                                                                                                                                                                                                                                                                                                                                                                                                             밁

The state of the s

```
The invention discloses isolated PRO secreted/transmembrane polypeptides can the nucleic acid encoding them. The polypeptides can be used to raise can the nucleic acid encoding them. The propertides can be used to raise can be useful to a cell expressing a PRO polypeptide, for linking a ccl bloactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity cof a cell expressing PRO polypeptides. PRO polypeptide are also useful cof a cell expressing PRO polypeptides. PRO polypeptides are also useful cof a cell expressing PRO polypeptides. PRO polypeptides are also useful cof a cell expressing PRO polypeptides are also useful cof gastrointestinal mucosa and the repair of acute and chronic mucosal cell esions, skin diseases associated with abnormal keratinocyte diseases, amyotrophic lateral sclerosis (RLS), neuropathies and cadditionally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be employed therapeutically in vivo for lessening the effects of viral cell in the propertides and their portions of their reversal, as an activity of a cell around the propertides and may also have an effect on kidney tissue. PRO polypeptides can be also used in assays to determine cell thas a role in apoptosis. The polymucleotides are useful in cell propertides and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of cell propertides and their portions affect the expression of cell propertides with full propertides and their polymucleotides are useful in cell propertides are useful in the development and screening of therapeutically useful respents, as probes and for the genetic analysis of individuals with genetic disorders

The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PCR; primer; 88; PRO; secreted; transmembrane; gastrointestinal mucosa; mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's disease; amyotrophic lateral sclerosis; ALS; neuropathy; acell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective;

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful of a cell expressing a PRO polypeptides are useful for treating disorders associated with the preservation and maintenance of a cell expressing PRO polypeptides are also useful of a cell expressing PRO polypeptides are also useful of a cell expressing PRO polypeptides and chronic mucosal differentiation (e.g. peoriasis), Parkinson sidesse, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. Cell propeptides also serves as tumour specific antigens which may be exploited as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine the fifth has a role in neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for hemorrhage as compared with reduced risk for hemorrhage as compared with heaparin, in treating other pRO-essociated diseases or their reversal, as an onlecular biology including uses as hybridisation probes for conk library to isolate the full-length PRO cDNA or to isolate other cDNAs, in molecular biology including uses as hybridisation probes for cNAs in molecular biology including uses as hybridisation probes for cNAs and DNAs chromosome and gene mapping, in the generation of antisense RNA and DNAs chromosome and gene mapping, in the development and screening of individuals with genetic disorders as well as for recembinatly or supersticularly useful respective as a purposes, as the rape of the propersion of the PRO polypeptide. Gromistic or protein electrophoresis purpose

New PRO polypeptides useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis and Usher syndrome.

Example SEQ ID NO 286; 468pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing pRO polypeptides. The propolypeptides are useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal with abnormal

> CC differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's CC additionally, disease related to uncontrolled cell growth, e.g. cancer. CC PRO polypeptides also serves as tumour specific antigens which may be carploited as therapeutically in vivo for lessening the effects of viral confection. The PRO polypeptides can be also used in assays to determine CC iff it has a role in neurodegenerative diseases or their reversal, as an cc antithrombotic agent with reduced risk for hemorrhage as compared with cc heparin, in treating other PRO-associated disorders, in modulating ce endometrial bleeding angiogenesis, and may also have an effect on kidney citseus. PRO polypeptides and their portions affect the expression of consolecular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in concloudate the full-length PRO cDNA or to isolate other CDNAs, in the generation of antisense RNA and DNA, concloudate the full-length PRO cDNA or to isolate other CDNAs, in the generation of antisense RNA and DNA, concloudate the full-length PRO cDNA or to isolate other CDNAs, in the generation of antisense RNA and DNA, concloudate the full-length PRO cDNA or to development and screening of containing PRO polypeptides, for generating transgenic animals or therapeutic animals with genetic disorders as well as for recombinantly concloudate are useful respective as a concentral and concloudate are useful concloudate and proteins are useful concloudate and proteins are useful concentral and conce

The invention discloses isolated PRO secreted/transmembrane polypeptides can the nucleic acid encoding them. The polypeptides can be used to raise of antibodies that specifically bind to the PRO polypeptides for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful correctly other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful correctly of a cell. PRO polypeptides are useful correctly of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides are also useful for reating disorders associated with the preservation and maintennance of for treating disorders associated with abnormal keratinocyte differentiation (e.g. poorlasis), parkinson's disease, Alzheimer's chieses, amyotrophic lateral sclerosis (ALS), neuropathies and cadditionally, disease related to uncontrolled cell growth. e.g. cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic antigens consecutive diseases or their reversal, as an cell in the propertides can be also used in assays to determine the propertide thas a role in neurodegenerative diseases or their reversal, as an cell in the propertides and their portions affect the expression of tissue. PRO polypeptides and their portions affect the expression of centering propertides and their portions affect the expression of consecutive biology including uses an hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNA, in chromosome and gene mapping, in the generation transgenic animals or knockout animals which are useful and provening are useful of the propertial subjective and propertial and proveins are useful for timunohistochemical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              staining and/or assay of sample fluids. Anti-PRO antibodies are useful diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-MAR-2003.

and the nucleic acid encoding them. The polypeptides can be used to raise can thotae acid encoding them. The polypeptide can the subset to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides in a sample and for linking a bloactive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte of a cell. PRO polypeptides are also useful of the PRO polypeptides are also useful of additionally, disease related to uncontrolled cell growth, e.g. cancer. RRO polypeptides also serves as tumour specific antigens which may be employed therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine the fifth has a role in neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for hemorrhage as compared with reduced risk for hemorrhage as compared with reduced risk for hemorrhage as compared with the partin, in treating other PRO polypeptides, and may also have an effect on kdaney tissue. PRO polypeptides and their portions affect the expression of molecular biology including uses as hybridisation probes for conk 1 thrary to isolate the full-length PRO cDNA or to isolate other cDNAs. In Chromosome and gene mapping, in the generation of antisense RNA and DNA. Chromosome and gene mapping, in the development and screening of therapeutically useful respectives, for screening compounds to identify those that minic the PRO polypeptide. For springer so wall as for recombinantly expression in the protein and for chromosome identification. The proteins are useful in the development and screening of the PRO polypeptide. Ge

The invention relates to human PRO polypeptides (secreted and CC transmembrane polypeptides) and the polypeptides encoding them. The CC polypeptides are useful for detecting PRO polypeptides and for linking a CC bioactive molecule to a cell expressing the polypeptides, where the CC bioactive molecule is a toxin, radiolabel or an antibody. The bioactive specific to the polypeptides are useful for modulating at least one Specific to the polypeptides are useful for modulating at least one CC biological activity of a cell expressing the polypeptides. The CC polypeptides are useful for treating disorders associated with leukocyte homing such as asthma, rheumatoid arthritis, sporiasis and multiple CC sclerosis, repair of acute and chronic mucosal lesions such as CC enterocolitis and Zollinger Ellison syndrome and for identifying agonists CC or antagonists of the polypeptides. The polymcleotides are useful as CC hybridization probes, in chromosome and gene mapping, in generation of CC antisense RNA and DNA, in the preparation (PCR), Northern analysis, and Western analysis. This sequence represents a PCR CC Southern analysis and Western analysis. This sequence represents a PCR primer used in isolation of a human PRO polymcleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-SEP-1998

```

New isolated secreted and transmembrane polypeptide, useful for treating diseases, e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis.

invention discloses isolated PRO secreted/transmembrane polypeptides the nucleic acid encoding them. The polypeptides can be used to raise

                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     contibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating cat least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides. PRO polypeptides are useful for resting the biological activity of a cell expressing properties. The PRO polypeptides or a sample and for linking a cell expressing properties. PRO polypeptides are useful for modulating the biological activity of a cell expressing properties. PRO polypeptides are useful for modulating the biological activity of a gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte diseases, amyotrophic lateral sciences of with almormal keratinocyte.

Confidence of the properties as the controlled cell growth, e.g. cancer. Republiced as therapeutic targets for anti-tumour drugs, and are also explosed therapeutically in vivo for lessening the effects of vital infection. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an anti-tumour transpared with the partin, in treating other PRO-associated disorders, in modulating the properties and their portions affect the expression of genes which have a role in apoptosis. The polymentectotides are useful in microllary to isolate the full-length PRO cDNA or to isolate other cDNAs, in the paperties which are useful in the development and screening of the rapeutically useful reagents, as physiciated other cDNAs, in the properties which are useful in the development and screening of the properties which are useful in the development and screening of the properties as which are useful for protein are useful in the development and screening of the properties as an interpretate and proteins as useful colleges of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison

Example 42; Page 109; 475pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a CC bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful CC for detecting other PRO polypeptides in a sample and for linking a CC bioactive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are also useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte diseases, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. QC differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's additionally, disease related to uncontrolled cell growth, e.g. cancer. QC englypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral conficients. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with heaven probes for polypeptides and their portions affect the expression of conficular biology including uses as hybridisation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other CDNAs, in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC chromosome and gene mapping, in the generation of antisense RNA and DNA, CC for preparing PRO polypeptides, for generating transgenic animals or CC knockout animals which are useful in the development and screening of CC therapeutically useful reagents, as probes and for the genetic analysis CC of individuals with genetic disorders as well as for recombinantly CC expressing the protein and for chromosome identification. The proteins CC the seeful as molecular marker for protein electrophoresis purposes, as CC therapeutic agents, for screening compounds to identify those that mimic CC the PRO polypeptide (agonists) or provent the effect of the PRO CC polypeptide (antagonists). The polyuncleotides and proteins are useful CC for tissue typing. PRO antibodies are useful for immunohistochemical CC tissue typing. PRO antibodies are useful for immunohistochemical CC tissue typing. PRO antibodies are useful for staining and/or assay of sample fluids. Anti-PRO antibodies are useful in CC clasmostic assays for PRO e.g. detecting the expression in specific CC cells, tissues or serum and for affinity purification of PRO from CC recombinant cell culture or natural sources. The PRO genes may also be CC used in gene therapy, particularly for replacing a defective gene. The CC sequence presented is a PCR priner which was used to amplify a PRO CC polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
